

MVPLUXCREATIONS – Codex Workflow Guide

Purpose: This document tells a new ChatGPT conversation exactly how to continue this project without losing time or introducing unnecessary changes.

1. Start Every New Chat

Upload this guide and the latest project summary PDF.
Explain the current goal in one sentence.
Do NOT ask Codex to build multiple features at once.
Work on one verified task at a time.

2. Rules for ChatGPT

Always begin by understanding the current code before editing.
Require proof of the root cause before changing code.
Prefer the smallest possible fix.
Never redesign unrelated parts.
Never touch authentication, checkout, pricing, Supabase, voting, galleries, customer showcase or images unless the task specifically requires it.
Never delete, rename, move, resize, compress or replace image files.
Preserve existing functionality.
If uncertain, stop and report findings instead of guessing.

3. How We Use Codex

We use ChatGPT to create precise instructions.
We paste only those instructions into Codex.
Codex performs code inspection and implementation.
After Codex finishes, ChatGPT reviews the results before the next task.

4. Terminal Workflow

Terminal #1:
`cd ~/MVPLUXCREATIONS`
`codex`

Terminal #2:
`cd ~/MVPLUXCREATIONS`
`python3 -m http.server 3000`

Browser:
`http://localhost:3000/index.html`
Refresh after every saved change.

5. What To Give Codex

Tell Codex exactly:

- the single feature or bug to work on
 - what files are allowed to change
 - what files are forbidden
 - what must be preserved
 - what tests to run afterwards
 - do not commit or push unless explicitly instructed
- Require a report before editing whenever possible.

6. Commits

Do NOT commit after every task.

Commit only after a group of related features or bug fixes has been tested.

Typical flow:

1. Fix several related issues.
2. Test locally.
3. Verify no regressions.
4. Create ONE checkpoint commit.
5. Continue working.

Push only after the checkpoint is confirmed.

7. Typical Codex Prompt Structure

1. Stop adding new features.
2. Fix only this specific issue.
3. Do not modify unrelated code.
4. Preserve images and existing functionality.
5. Explain the root cause.
6. Implement the smallest fix.
7. Run syntax checks.
8. Run git diff --check.
9. Verify locally.
10. Stop before commit or push.

8. Current Priorities

- Stabilize Admin.
- Fix draft publishing.
- Verify website publishing.
- Fix image positioning.
- Fix card ordering.
- Verify category assignment.
- Test before committing.

9. Documents

A new chat does not need every source file pasted into the conversation.

Provide:

- this workflow guide
- the latest project summary PDF

- only the specific code files related to the current task if ChatGPT asks for them. Large unrelated files should not be pasted unless needed.

10. Goal

Keep Codex focused, avoid unnecessary edits, reduce cost, and make larger, well-tested checkpoint commits instead of many small commits.
